

## PYTHON HANDWRITTEN NOTES

**Prepared By:** 

	What is Programming ? What is Programming ? Hindi or English to Communicate
	Just like we we use a programming
	language like Python to communicate with
	The computer.  Programming is a way to instruct the computer
	to perform various tasks.
	What is Python?
	Python is a simple and easy to anacosmple language which feels like reading simple makes
	english. This Pseudo Code nature of bython mikes if easy to learn and understandable by beginners
	Fasy to understand = Less development time
	Features of Python  Easy to understand = Less development time  Free and open source  High level language  Portable > Works on Linux/Windows/Mac.  Tun to work with
	Portable -> Works on Linux/Windows/Mac.
	Python can be lasily installed from python org When you click on the download button, python Can be installed right after you complete the Setup by executing the file for your platform
	When you click on the soundon button, pyrnon complete the getup
/	by executing the file for your platform
	(C)
	Just install  it like a game!

	Chapter 1: Modules, Comments & pip
	The second secon
	Total action of the second
	Lets well our very just by mon program
	Ochate is file called helloby and paste the
	Lets write our very first by thon program. Create a file called hello-by and paste—the below code in it
	print ("Hello World") -> print is a function (More later)
	Trees to Win Cile/ by Cile I. L. L. L. W I. W.
	Eccline This file (py file) by typing python hello py
	Juna you will see Hello World printed on the
· 1	Execute this file (by file) by typing bython hello by and you will see Hello World printed on the Screen.
, 1.	
	Modules
	A module is a file containing code written by somebody else (usually) which can be imported and used in our programs  D: b
	hu somehody else (venall) which san he
	installed and the state of the
	THE JOINE WINE USED IN OUR DROGRAMS
	O. I
	Lib
•	Pip is the package manager for python You can use pip to install a module
	You can use pip to install a module
	on your system
	pip install flask installs flask module.
	TWK MORULE.
	Tuber at makeler
	Types of modules
	There are two types of modules in Python
7	Built in modules -> Pre installed in button
22	External modules - Need to install using pip.
	Some examples of built in modules are as -10 al-
	Some examples of built in modules are os, abc, et.  Some examples of external modules are tensorf bw, flosk et.
	Donne Champies of Vertilia Mountes are tensorphy of lost etc-

•	
	Using Python as a Calculator  We can use python as a Calculator by  typing "python" + I on the ferminal  I This opens REPL  or Read Evaluate Print loop
	We wan use python as a calculator by
	typing bython + I on the ferminal
	This obens REPL
	Or Read Evaluate Print Int
	Comments
	Comments are used to write something which the programmer does not want to execute.
	the hyperammer does not want to execute
	The programmer was in the same

	Chapter 2 - Variables and Datatypes
- <del> </del>	A variable is the name given to a memory location in a program for example
V.	0 = 30
1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	C = 71.22    Keywords = Reserved words in Python  Identifiers = Class/function/variable name  Data Types
7	Data Types Primarily there are following data types in Python Integers
27 37	Floating point numbers Strings
4,	Booleans
5/	
	Python is a fantastic language that automatically identifies the type of data for us.
	a = 71 ⇒ Identifies a as class sint> b = 88.44 ⇒ Identifies b as class < float> name = "Harry" ⇒ Identifies name as class < 5tr>
<b>→</b>	Rules for defining a Variable name -> Also applies to other Huttjers A variable name can Contain alphabets, digets
	A Variable name can only start with an alphabet
	Will William .
<b>→</b>	A variable name cant start with a digit No while space is allowed to be used inside
<b>→</b>	No while space is allowed to be used inside  a variable name.

	tramples of a few variable names are: harry, one8, seven, -seven etc.
	harry, one 8, seven _ seven etc.
	Operators in Python
	following are some common oberafors in Python:
1.7	Following are some common operators in Python: Arithmetic operators => + -, *, / etc.
27	HSSignment oberators => = += , -= et.
3,	Comparison operators $\Rightarrow ===,>,>=,\angle,!=etc.$ Logical operators $\Rightarrow$ and, or, not
4,	Logical oberators => and or not
	type () function and Typecasting
	type () function and Typecasting type function is used to find the data type of a given variable in Python
	a Joven variable in Python.
	a = 31
	type(a) => class < int>
	V'
	b = "31"
	type (b) => class 25tr>
	A number San be converted into a String and Vice versa (If possible)  There are many functions to sonvert one data type into another
	Vice versa (If possible)
	There are many functions to convert one data type
	into another
	5tr (31) => "31" => Integer to String Conversion
	Int ("32") => 37 => Strump to Integer Conversion
	int (" 32") => 32 => String to Integer Conversion  float (32) => 32.0 => Integer to float Conversion
$\downarrow$	
	os and so on
	Here "31" is a string literal and 31 a numeric literal.

	Input () function  This function allows the user to take input  from the keyboard as a String
	from the keyboard as a string
	a = input (" Enter name") => If a is "harry" the
	user entered harry
	It is important to note that => If a is "34" were
	It is important to note that => If a 15 34 wer
	the output of input is always entered 37
	a String (even if the number  is entered)
9	13 Villa )
•	The state of the s
	A Iniz Mail 12 / retained
-	
<b>\</b>	TOPPERWorld
	The state of the s
,	
	Vive and the second sec
	The state of the s

	Chapter 2 - Practice Set
1	Write a Python program to add two numbers
2 = =	Write a Python program to find remainder when a number is divided by Z
3 :	(heck the type of the variable assigned using input () function.
4 = = = = = = = = = = = = = = = = = = =	Use Comparison operators to find out whether a given variable a is greater than b or not.  Take a = 34 and b = 80
5 /	Write a python program to find overage of two numbers entered by the user.
6 :	Write a python program to calculate square of a number entered by the user.

Chapter 3 - Strings
String is a data type in Python.
String is a data type in Python.  String is a sequence of characters enclosed in quotes.  We can primarily, write a string in these three ways
1. Single quoted strings $\rightarrow$ $a = 'Horry'$ 2. Double quoted strings $\rightarrow$ $b = "Harry''$ 3. Triple quoted strings $\rightarrow$ $c = '''$ Harry''
3, Triple quoted Strings -> c = 111 Harry 111
String Slicing
part of the String-
String Slicing A string in Python can be sliced for getting a part of the String- Consider the following string:
name = $\frac{1}{4} \frac{1}{a} \frac{1}{r} \frac{1}{r} \frac{1}{y} = \frac{1}{2} \frac{1}{4} = \frac{1}{2} \frac{1}{4}$
The index in a string starts from 0 to (length-1) in Python. In order to slice a string, we use the following syntax:
st = name [ind_start : ind_end]  first index included
Sl[0:3] returns "Har" → characters from 0 to 3  Sl[1:3] returns "ar" → characters from 1 to 3
Negative Indices: Negative Indices can also be used as shown in the figure above1 corresponds to the (length-1) index, -2 to (length-2)

•	
5,	String find (word) - This function finds a word and returns the index of first occurrence of that word in the string.
6 >	String replace (Oldword, newword) - This function replaces the oldword with newword in the entire string.
	Estake Sequence Characters Sequence of characters after backslash' -> Estake Segrenarions'
	Escape sequence character comprises of more than one characters but represents one character when used within the strings
	Examples n, t etc.  newline Tab Singlequok backslash
4	TOPPERWORLA
	La transport of the second of

	ERBAN
	Chapter 3 - Practice Set
1	Write a Python program to display a user entered name followed by Good Afternoon using input () function
2	Write a program to fill in a letter emplate given below with name and date.
	letter = 111 Dear <   NAME 17,  You are Selected!  <1 DATE 17 11
3 =====================================	Write a program to detect double spaces in a string
4	Replace the double Spaces from Problem 3 with Single Spaces.
5	Write a program to format the following letter using estape sequence characters.
	letter = "Dear Harry, This Python Course is nice. Tranks!"
· · ·	<u> </u>

•	
	Chapter 4 - Lists and Tuples
	Python Lists are sontainers to store a set of values of any data type
	friends = ["Apple", "Akash", "Rohan", 7, false]  Street  Can store Value of any  datatyte
	datatyfe
	List Indexing A list san be indexed just like a string
· · · · · · · · · · · · · · · · · · ·	L1 = [7,9,"Harry"]
	L1[0] => 7
. *	[1[1] => 9
	[1[70] => Error
	[1[0:2] => [7,9] => List Sliving
, ,	List Methods Topperational
	Consider the following list:
*	landina di Santania di Barata in Salam Antoni in Salam Santania di Santania di Santania di Santania di Santani
	L1 = [1,8,7,2,21,15]
7	11. Sort(): updates the list to [1, 2, 7, 8, 15, 21]
27	[1. reverse(): updates the list to [15, 2), 2, 7, 8, 1]
3,	L1. append (8): adds 8 at the end of the list
4,	L1. insert (3,8): This will add 8 at 3 index
_	

5, [1. pap (2): Will delete element at index 2 and return its value  6, [1. remove (21): Will remove 21 from the list  Tuples in Python  A tuple is an immutable data type in python  Gamoot change  Q = () => Empty tuple Q = (1,) => Tuple with only one element needs a comma Q = (1,7,2) => Tuple with more than one element  Once defined a tuple selements cant be altered or manipulated.  Tuple methods (anxider the following tuple Q = (1,7,2)  1. a (Dunt (1): A Count [1) will return number of times 1 Occurs in a.  2. O index (1): A indux (1) will return the index of first occurrence of 1 in A.	EDG3
1 L1. remove (21): Will remove 21 from the list.  Tuples in Python  A tuple is an immutable data type in python.  Ly Commot change  a = (1) => Empty tuple  a = (1, 1) => Tuple with only one element needs a comma  a = (1, 7, 2) => Tuple with more than one element  Once defined a tuple's elements cant be altered on manipulated.  Tuple methods  (onsider the following tuple  a = (1, 7, 2)  1. a (ount (1): a (ount [1) will return number of times 1 occurs in a.  2. a index (1): a index (1) will return the index of first	
Tuples in Python  A tuple is an immutable date type in python.  Ly Conmot change  a = (1) => Empty tuple  a = (1, 1) => Tuple with only one element needs a comma  a = (1, 7, 2) => Tuple with more than one element  Once defined a tuple's elements cant be altered or manipulated.  Tuple methods  (onsider the following tuple  a = (1, 7, 2)  1. a. (ount (1): a. (ount [1) will return number of times 1  occurs in a.  2. a. index (1): a. index (1) will return the index of first	5, L1. pap (2): Will delete element at index 2 and return
Tuples in Python  A tuple is an immutable data type in python.  \[ \text{\text{\text{Canmot change}}} \]  \[ \text{\text{\text{\text{Canmot change}}}} \]  \[ \text{\text{\text{\text{Canmot change}}}} \]  \[ \text{\text{\text{\text{\text{Canmot change}}}} \]  \[ \text{\t	its value
Tuples in Python  A tuple is an immutable data type in python.  \[ \text{\text{\text{Canmot change}}} \]  \[ \text{\text{\text{\text{Canmot change}}}} \]  \[ \text{\text{\text{\text{Canmot change}}}} \]  \[ \text{\text{\text{\text{\text{Canmot change}}}} \]  \[ \text{\t	
Q = (1,) => Tuple with only one element needs a comma Q = (1, 7, 2) => Tuple with more than one element  Once defined a tuple's elements cant be altered or manipulated  Tuple methods (consider the following tuple Q = (1, 7, 2)  1. a. (ount (1): a. (ount [1) will return number of times 1 occurs in a.  2. O. index (1): q. index (1) will return the index of first	67 L1. remove (21): Will remove 21 from the list.
Q = (1,) => Tuple with only one element needs a comma Q = (1, 7, 2) => Tuple with more than one element  Once defined a tuple's elements cant be altered or manipulated.  Tuple methods (consider the following tuple Q = (1, 7, 2)  1. a (ount (1): a · (ount [1) will return number of times 1 occurs in a.  2. O · index (1): a · index (1) will return the index of first	Tullar : Du
Q = (1,) => Tuple with only one element needs a comma Q = (1, 7, 2) => Tuple with more than one element  Once defined a tuple's elements cant be altered or manipulated.  Tuple methods (consider the following tuple Q = (1, 7, 2)  1. a (ount (1): a · (ount [1) will return number of times 1 occurs in a.  2. O · index (1): a · index (1) will return the index of first	Jupis in Fython
Q = (1,) => Tuple with only one element needs a comma Q = (1, 7, 2) => Tuple with more than one element  Once defined a tuple's elements cant be altered or manipulated.  Tuple methods (consider the following tuple Q = (1, 7, 2)  1. a (ount (1): a · (ount [1) will return number of times 1 occurs in a.  2. O · index (1): a · index (1) will return the index of first	The tape is suit immunable dated type in python.
Q = (1,) => Tuple with only one element needs a comma Q = (1, 7, 2) => Tuple with more than one element  Once defined a tuple's elements cant be altered or manipulated.  Tuple methods (consider the following tuple Q = (1, 7, 2)  1. a (ount (1): a · (ount [1) will return number of times 1 occurs in a.  2. O · index (1): a · index (1) will return the index of first	- anmot change
Q = (1,) => Tuple with only one element needs a comma Q = (1, 7, 2) => Tuple with more than one element  Once defined a tuple's elements cant be altered or manipulated.  Tuple methods (consider the following tuple Q = (1, 7, 2)  1, a. (ount (1): A. (ount [1) will return number of times 1 occurs in a.  2, O. index (1): a. index (1) will return the index of first	
Once defined a tuple's elements can't be altered or manipulated.  Tuple methods (consider the following tuple	0 = (1.) => Tuble with only one element needs a comma
Once defined a tuple's elements can't be altered or manipulated.  Tuple methods  (onsider the following tuple  a = (1, 7, 2)  1. a. (ount (1): a. (ount [1) will return number of times 1 occurs in a.  2. a. index (1): a. index (1) will return the index of first	a = (1,7,2) => Tuble with more than one element
Tuble methods  (onsider the following tuble  Q = (1, 7, 2)  1. a. (ount (1): a. (ount [1) will return number of times 1  occurs in a.  2. a. index (1): a. index (1) will return the index of first	
Tuble methods  (onsider the following tuble  Q = (1, 7, 2)  1. a. (ount (1): a. (ount [1) will return number of times 1  occurs in a.  2. a. index (1): a. index (1) will return the index of first	Once defined a tuple's elements can't be aftered
Tuble methods  (onsider the following tuble  Q = (1, 7, 2)  1. a. (ount (1): a. (ount [1) will return number of times 1  occurs in a.  2. a. index (1): a. index (1) will return the index of first	or manipulated.
1. a. (ount (1): A. (ount [1) will return number of times 1  Occurs in a.  2. O. index (1): a. index (1) will return the index of first	
1. a. (ount (1): A. (ount [1) will return number of times 1  Occurs in a.  2. O. index (1): a. index (1) will return the index of first	Tuple Methods
1. a. (ount (1): a. (ount [1) will return number of times 1 occurs in a.  2. a. index (1): a. index (1) will return the index of first	Consider the following taple
2> 0 index (1): a index (1) will return the index of first	$\frac{(-1,+,h)}{(-1,+,h)}$
2> 0 index (1): a index (1) will return the index of first	1-a. (ount 1): A. (ount [1) will return number of times 1
27 O. index (1): a. index (1) will return the index of first	
occurrence of 1 in A.	27 O. index (1): a. index (1) will return the index of first
	occurrence of 1 in Q.

	Chapter 4- Practice Set
1	Write a program to store seven fruits in a list entered by the user.
2	Write a program to accept marks of 6 students and display them in a sorted manner
3 =	Check that a tuble rannot be changed in python
4	Write a program to sum a list with 4
5	Write a program to count the number of Zeros in the following tuple:
	a = (7,0,8,0,0,9)

·	Chapter 5: Dictionary & Sets
	Dictionary is a collection of key-value pairs
	Syntax: keys Values
	Syntax: keys Yalus  Q = 2 "key": "Value",  "harry": "Gde",
	"harry" "(ade"
	"marke" - " 100."
	"marks": "100", "list": [1,2,9] }
. 1	
	a ["key"] => Prints "Volue"
. 4	a ["list"] => Prints "Value"  a ["list"] => Prints [1, 2, 9]
`.	1 01XVX 1 1 1 .
, .	Properties of a Python Dictionaries
372	It is unordered
2.7	It is mitable
37	It is indexed
47	Cannot Contain duplicate keys
	Wiving to (water)
\f\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\	Dictionary Methodes
i	Consider the following dictionary
	Charles I would
	Q = 2 "name": "Harry",
-	"from"; "Intio".
	"from": "India", "marks": [92,98,96] }
1.	a. items(): returns a list of (Rey, value) tuples
	·
17	a keys(): returns a list containing dictionary's keys
	·
3	a update (&"friend": "Sam"}): updates the dictionary with Supplied key-value pairs
-3/	Subblied Ren - Volus baites
	July pay 1232   Save
	<u> </u>

4: 0. get ("name"): Returns the value of the specified keys (and Value is returned eg "Harry" is returned here)
keys (and Value is returned
"Harry" is returned here)

More methods are available on docs python org
Set is a collection of non repetitive elements
Det 18 in Collection of non Vegetitive elements
G = Set () => No repetition allowed!
S= Set() => No repetition allowed!
$\begin{array}{c} 5. \text{ add } (1) \\ 9. \text{ add } (2) \end{array}$ $\Rightarrow \text{ or } \text{ Set} = \{1, 2\}$
If you are a programming beginner without much
Rnowledge of mathematical operations on sets, you can
Simply look at sets in python as data types
Containing Unique Values.
If you are a programming beginner without much knowledge of mathematical operations on sets, you can simply look at sets in python as data types containing unique values.  Properties of Sets
12 Sets are unordered > Element's order doesn't matter
2- Sets are unindexed > Cannot access elements by index
37 There is no way to change items in sats.
4, Sets connot contain duplicate values
The state of the s
Operations on Sets
Consider the following Set:
5= 21,8,2,33
12 len le V. Palinne of the la this of the cot
17 len(s): Returns 4, the length of the set
2, 5. remove (8): Updates the set 5 and removes 8 from 5
The same of the sa
<b>1</b> 1

3. S. pop(): Removes an Arbitrary element from the Set and testures the element vermoved.  4. S. Clear (): Empties the set 5  5. S. Union (28,113): Returns a new set with all items from both sets. => \(\frac{2}{3}\), \(2,2\), \(2,3\), \(2,3\)  6. S. Indersection (\(\frac{2}{3}\), \(2,\) \	· · · · ·	EDG3
5 7 S. Union $\{\xi, 8, 113\}$ . Returns a new set with all items from both sets. $\Rightarrow \xi 1, 8, 2, 3, 113$ 6 > S. intersection $\{\xi, 8, 113\}$ . Returns a set which contains only items in both sets. $\Rightarrow \xi 83$ R1 R2 R3 R1+R3+R3 $\Rightarrow A \cap B$ R1+R3 $\Rightarrow A \cap B$ R1+R3 $\Rightarrow A \cap B$ R1+R3 $\Rightarrow A \cap B$ R2 R3 R1+R3 $\Rightarrow A \cap B$ R3 $\Rightarrow A \cap B$ R4 $\Rightarrow A \cap B$ R5 R4 $\Rightarrow A \cap B$ R5 R5 $\Rightarrow A \cap B$		
R1  R2  R3  R1+R2+R3 $\Rightarrow$ ADB  R1+R3 $\Rightarrow$ ADB  R1+R3 $\Rightarrow$ ADB  R1+R3 $\Rightarrow$ ADB  R2  R3  R1+R3 $\Rightarrow$ ADB  R3  R4  R4  R5  R5  R5  R6  R7  R6  R7  R7  R7  R7  R8  R9  R9  R9  R9  R9  R9  R9  R9  R9	57	5. Union / 9. 8. 113) : Returns a new set with all

	Chapter 7 - Loops in Python
	Sometimes we want to repeat a set of Statements in our program. For instance: Print 1 to 1000
	Loops make it easy for a programmer to tell  the computer, which set of instructions to repeat  and how!
17	Types of loops in Python Primarily there were two types of loops in Python While loop For loop
	We will look into these one by one!
	While loop  The syntax of a while bop looks like this:
	While Condition: The block Reaps executing until the Body of the loop condition is true
	In while loops, the condition is shecked first If it evaluates to true, the Body of the loop is executed, otherwise not!  If the loop is entered, the process of [condition check & execution] is continued until the condition becomes false.
	Quick Quiz: Write a program to print 1 to 50 using a while loop.

,	An Example
	i = 0  while i < 5:   print ("Harry")  i = i + 1
	Note: If the condition never becomes false, the
	Quick Quiz: Write a program to print the content of a list using while 100/28.
	For loop  A for loop is used to iterate through a sequence like  list, tuple or string [Herables]
	The syntax of a for loop looks like this:
	$l = [1, 7, 8]$ for item in l: $print (item) \rightarrow print 1, 7 and 8$
	Range function in Python  The trange function in python is used to generate  a sequence of numbers:
	We can also specify the Start, Stop and Step 100
	range (Start, Stop, Step Size is usually not used with rangel)

<del></del>	
	The continue Statement
	'continue' is used to stop the current iteration
	of the loop and continue with the next one
	'Continue' is used to stop the current iteration  of the loop and continue with the next one  It instructs the program to "skip this iteration"
	Example:
	for i in range (4):  print ("printing")  if $i = 2$ : $\Rightarrow$ if i is 2, the distinction  Continue is 5 kipped
	print ("printing")
	if $i = 2$ : $\Rightarrow$ if $i$ is 2, the decolumn
	Continue is skipped
	print (i)
	pass stakment
	pass is a null Statement in python It instructs to "Do nothing"
	It instructs to "Do nothing"
The second secon

	Chapter 7 - Practice Set
1	Write a program to print multiplication table of a given number using for loop.
2	Write a program to greet all the person names Stored in a list 11 and which starts with 5
	l, = ["Harry", "Soham", "Sachin", "Rahul"]
3	Attempt problem 1 using while loop.
4	Write a program to find whether a given number is prime or not
5	Write a program to find the Sum of first n natural numbers using while loop.
6	Write a program to salculate the factorial of a given number using for loop.
7 =	Write a program to print the following star pattern
	****  ***  ***  ****  ****  ****  ****  ****
8	Write a program to print the following star pattern:
	* * * * * * * * * * * * * * * * * * *

Chapter 8 - Functions & Recursions
A function is a group of statements performing.  A specific task.
When a program gets bigger in Size and its complexity grows, it gets difficult for a programmer to keep track on which piece of code is doing what!
A function can be reused by the programmer in a given program any number of
Example and Syntax of a function The syntax of a function looks as follows:
def func 1 ():  print ("Hello")
This function can be called any number of times, anywhere in the program.
Function (all Whenever we want to sall a function, we put the name of the function followed by parenthesis as follows:  func 1() -> This is called function call
function definition The part containing the exact set of instructions which we executed during the function call.

L
Quick Quiz: Write a program to greet a user with "Good day" using functions.
Types of functions in Python:  There are two types of functions in Python:  17 Built in functions  There are two types of functions in Python  18 Built in functions  Pefined by the user
Examples of built in function includes len()  print(), vange() etc.  The line 1/1 Cunction We defined 15 an example
The function we defined is an example  of user defined function  Functions with arguments
A function can succept some varies as the parenthesis  A function can value values as shown below:
def greet (name) topper World  gr = "Hello" + name  yetwen gr
return yr  A "Harry" is passed to greet in name  α = greet ("Harry")  α will now contain "Hello Harry"
Default Parameter Value We can have a value as default argument in a function.
If we specify name = "stranger" in the line containing def, this value is used when no argument is passed.

<u> </u>	
ــــــــــــــــــــــــــــــــــــــ	
	The programmer need to be eathernely careful intil
/	The programmer need to be extremely careful while working with recursion to ensure that the function doesn't Infinitely keep calling itself.  Recursion is sometimes the most direct way to code an
<b>ノ</b> ーーーー	to the total the best colling itself
	function doesn't infinitely keep laxway itsus.
	Recursion is sometimes the most direct way to code an

Reading a file in python
f = open (" this txt ) open the file in roll  text = f. read() -> Read its Contents  text = f. read() -> Print its Contents
print (text)
f. close () - Close ()
We can also specify the number of characters in
F. close () -> Close The property of Characters in     We can also Specify the number of characters in     read () function: f. read (2)     L.> Reads first 2 characters
Other methods to read the file  We can also use f-readline() function to read  on full line at a time
We can also use f-readline () function to read
fireadline() -> Reads one line from the file
Modes of opening a file
TOPPER World
V → open for reading  W → open for writing
a -> open for appending
+ - pen for updating
rb will open for read in binary mode  'rt' will open for read in text mode
rt' will open for read in text mode
Writing files in Python
In order to write to a file we first open it in
by then's f. write() method to write to the file!

= open ("this txt", "w")

write ("This is nice") → (an be called multiple times

Close() The best way to open and close the file automatically is the with Statement with open ("this txt") as f - Don't need to write

<del></del>	·	
		Chapter 9 - Practice Set
	1	Write a program to read the feat from a given file poems txt and find out whether it contains the word twinkle.
,	2	The game () function in a program lets a user play a game and returns the Scote as an integer. You need to read a file 'History txt' which is either blank or contains the previous Hi-score.  You need to write a program to update the Hi-score whenever game() breaks the Hi-score.
	3/2	Write a program to generate multiplication tables from 2 to 20 and write it to the different files. Place these files in a folder for a 13- year old.
	4	A file Contains a word "Donkey" multiple times you need to write a program which replaces this word with ###### by updating the Same file.
	5	Repeat program 4 for a list of such words to be consored:
	6	Write a program to prime a log file and fine
	7	Write a program to find out the line number. Where python is present from Ques 6

· · ·	Chapter 10 - Object Oriented Programming
	Solving a problem by creating objects is one of the most popular approaches in programming. This is called Object oriented programming.
	This concept focuses on using reusable code.  Implements DRY principle
	Class A class is a blueprint for creating objects.
	Conhins info to Creak a valid Application Form  Student > Application Of the Shudent
	class = Object instantiation => Object
	Contains into to Create a valid object
	The syntax of a class looks like this:
	Class Employee: [ Class name is weithen in Paradlese]  ## methods & Variables
-	Object
	An Object is an instantiation of a class. When class
	is defind, a template (info) is defined. Memory is
_	An Object is an instantiation of a class. When class is defined, a template (info) is defined. Memory is allocated only after object instantiation.
	available to it without revealing the inclination
	Objects of a given class can invoke the methods available to it without revealing the implementation details to the user.

	Modelling a problem in 00Ps We identify the following in our problem
	We identify the following in our problem
	Noun -> Class -> Employee
	Adjective -> Altributes -> name, age, salary
	Adjective -> Altributes -> name, age, solary  Verbs -> McHods -> get Salary(), increment()
	Class Attributes
	FITE Allevious That Dolongs to the class vather than
	Class Attributes An Attribute that belongs to the class rather than a particular object.
	Example:
	·
	Class Employee:
	Class Employee:  (ompany = "Google" → [Specific to each class]
	harry = Employer() -> object instantiation
	harry Company
	harry · Company = "YouTube" -> changing class attribute
	An attribute that belongs to the Instance (object) Assuming the class from the previous example:
	An allabate that occords to the instance (object)
	Hissuring The class from the previous example:
	horry name = "Harry"
_	harry name = "Harry"  harry 5alary = "30 K" => Adding instance attributes
-	
	Note: Instance attributes take preference over class attributes during assignment & retreival
	during assignment & retrieval
_	
	harry attribute 1 -> (1) Is attributed present in object?
	2) Is attributed present in class?

self parameter self refers to the instance of the class It is automatically passed with a function call from an object
harry get Salary () > here self is harry  Comivalent to Employee get Salary (harry)
The function getsalary is defined as:
Class Employee:  Company = "Google"  def get Salary (Self):  print ("Salary is not there")  Static method  Sometimes we need a function that doesn't use the Self parameter: we can define a static method like this:
@Staticmethod -> decorator to mark great def greet(): as a static method frint ("Hello user")
init() (onstructor init() is a special method which is first run as soon as the object is created: init() method is also known as constructor
It takes self argument and can also take further arguments

 EDG3
 For Example:
 Class Employee:  def init (self, name):  Self-name = name
 del init (self name).
Self-name = name
 def get Salary (Self):
 0.00
MAKKU - Employed ("Hakku")
harry = Employee ("Harry")  Deject can be instantiated using constructor like this!
using constructor like this!

	Chalter In Practice Set
	Chapter 10 - Practice Set
1	Create a class programmer for storing information of few programmers working at mycrosoft.
	of few programmers working at mycrosoft.
2	,
4	Write a class calculator capable of finding square, Cube and square root of a number.
2	
	Create a class with a class attribute a; create an object from it and set a directly using object a = 0. Does this charge the class attribute?
	Object a = 0. Does this change the class attribute?
//	Add a static method in problem 2 to great the user with hello.
5	a light act Status (mo of certs) and act face
	information of trains running under Indian
	Write a class Train which has methods to book a ticket, get Status (no of Seats) and get fare information of trains running under Indian Railways.
b	
3	to something else (say harry). Try changing sef
	(an you change the self parameter inside a class to something else (say 'harry'). Try changing self to 'sif' or 'harry' and see the effects.

Chapter 11 - Inheritance & more on OOPs
Inheritance is a way of creating a new class from an existing class
Syntax:
Class Employee: → Base Class # Code
Class Programmer (Employee): → Derived or child class
Class Programmer (Employee): → Derived or child class # code
We can use the methods and attribute of Employee in Programmer object. Also, we can overwrite or add new attributes and methods in Programmer class.
Types of Inheritance TOPPERWorld
Single inheritance Multiple inheritance Multilevel inheritance
Single Inheritance Single inheritance occurs when shild class inherits Only a single parent class
Base U Derived

	Multiple Inheritance Multiple inheritance occurs When the schild class inherits from more than one parent class.
	Parent 1 Parent 2
	Mulfilevel Inheritance When a child class becomes a parent for another child class
	Parent 1 Child 1
	Super () method Super method is used to access the methods of a Super class in the derived class
	Super()init()  Lalls constructor of  the base class
	Class methods A class method is a method which is bound to the class and not the object of the class.  Classmethod decorator is used to create a class method

	Syntax to create a class method:
	@ Classmethod def (cls, p, pz):
	000
	Oproperty decorators Consider the following class
	Constant the following class
	Class Employee:
	@ property
	<pre>property  def name (self):</pre>
	return Self-Ename
	if e = Employee() is an object of class employee
	if e = Employee() is an object of class employee, we can print (e-name) to print the ename/call name() function.
-	
	@ getters and @ setters  The method name with eproperty decorator is called getter method
	method
	We can define a function + @ name setter decorator like
	below:
	@ name. Setter
	def name (self, Value):  Self. ename = Value
	,
	Operators in python can be overbaded using dunder
	methods.
	These methods are called when a given operator is
	used on the objects.

 operators in bython can be overloaded using the following methods:
$b_1 + b_2 \longrightarrow b_1 - add - (b_1)$
$\begin{array}{cccccccccccccccccccccccccccccccccccc$
$\begin{array}{cccccccccccccccccccccccccccccccccccc$
Other dunder/magic methods in python  Str_() -> used to Set what gets displayed  upon calling Str(obj)
 len() → used to set what gets displayed upon (allinglen() or len(obj)

· · · · · · · · · · · · · · · · · · ·	
1	Override the len-L) methon on Vector of problem 5 to display the dimension of the vector.
	vector.

	Chapter 12 - Advanced Python 1
<u></u>	
	Exception Handling in Python  There were many built-in exceptions which are raised  in Python when something goes wrong.  Exceptions in Python can be handled using a try  Statement. The code that handles the exception
,	There were many built-in exceptions which are raised
	In Python when something goes weong.
-	Exceptions in Tython can be handled using a try
	Statement The code that panales the exception
,	is written in the except clause.
	ku o
	fey:  # code   → Code which might throw
	exception as e: Exception.
	print (e)
	When the exception is handled the code flow continues
	When the Exception is handled, the code flow continues without program interruption.
	We can also specify the exceptions to catch like below:
t d	try; TOPPERWorld
	# Code
	Cacept ZeroDivision Error:
	# Code
	except TypeFrance
	except TypeFnor: # code
	Except:  # code  # li other exceptions
	# Code - All Man All
	# code -> All other exceptions  are handled here.
	a rurajea ruce.
	Raising Exceptions
	We can Kaise sustain enall:
	We can raise sustain exceptions using the raise keyword in python.

	The global keyword  global keyword is used to modify the variable outside  of the current scope:
	Enumerate function in Python  The cnumerate function Adds counter to an iterable  and returns it
	for i, i tem in list 1:  print (i, i tem)  Prints the i tems of list 1  with index!
	list Comprehensions  list Comprehension is an elegant way to create lists  based on existing lists
	based on existing lists  list $1 = [1, 7, 12, 11, 22]$
	list 2 = [i for item in list 1 if item 78]
\	

•	
	Chapter 13 - Advanced Python 2
	Virtual Environment
	An environment which is some as the system
	An environment which is some as the system interpretor but is isolated from the other python environments on the system.
	Installation To use virtual environments, we write
	pip install virtualenv → Install the package
	We create a new environment using:
	Virtualenv myprojectenv -> Creates a new venv
	The next step after creating the virtual environment is to activate it
	We can now use this virtual contration was a
	separate python installation.
	pip freeze returns all the packages installed in a given python environment along with the versions
	pip freeze > requirements . txt
	The above command creats a file named requirements tet in the same directory containing the output of
	bib freeze.  We can distribute this file to other users and  They can recreate the same environment using:
` <u>.                                    </u>
